SUMMARY

Experienced software engineer with a strong background in building scalable data platforms and modernizing legacy systems. Delivered a MongoDB caching layer that cut cache refresh time by 99% and a real-time Kafka-Spring Boot event streaming pipeline for trade activity monitoring. Also led migration of a 100 TB/day log pipeline to BigQuery, reducing costs by 40% and boosting query speed 15-fold. Seeking to apply expertise in distributed systems and cloud-native architectures to drive high-availability solutions.

EXPERIENCE

Goldman Sachs **Dec 2024 - Present**
Software Engineer 2 *Salt Lake City, UT*

- Designed and rolled out a MongoDB caching layer to handle highly sensitive PC-3 data, slashing cache refresh times by 99% (from 6 hrs to 15 mins). Built in strict access controls and audit logging to monitor data access/usage.
- Led an independent module in modernizing a legacy application, overseeing analysis, requirements gathering, upgrading the system from JDK 6 to JDK 21, and deploying it on Kubernetes, which refreshed the platform and enabled continued support.
- Streamlined the deployment architecture for compliance microservices using Docker and Kubernetes, reducing release overhead and ensuring high availability for daily operations.
- Built a real-time event streaming pipeline using Kafka and Spring Boot to track trade activities, automating the data flow for auditors and transforming what used to be weeks of manual review into a near-instant workflow.

DataRobot **May 2024 - Sep 2024**
Software Engineer Intern *Boston, MA*

- Delivered a Streamlit front-end backed by TensorFlow-Serving that 1k+ analysts use weekly; reduced p99 inference latency by 50% through request batching and GPU sharing.
- Published a TypeScript component library with Storybook documentation; adopted by five product teams and reduced UI development effort by ~60%.
- Enabled server-side rendering and route-level code-splitting on the React application, raising the Lighthouse performance score from 62 to 90.

Addgene **May 2023 - Dec 2023**
Software Engineer *Boston, MA*

- Integrated WebSocket-based order tracking that updates customers in real time, cutting “where is my shipment?” support tickets by 50%.
- Introduced Redis caching and optimized two Postgres queries, dropping p99 API latency from 300 ms to 50 ms while handling 5× traffic growth.
- Implemented an OAuth2 gateway with JWT validation that blocked 99.9% of unauthorized access attempts on a 200k sample repository.

Quantiphi **May 2021 - Aug 2022**
Software Engineer *Mumbai, India*

- Migrated a 100 TB/day log-analytics pipeline from Elasticsearch to BigQuery with Apache Spark, reducing infrastructure cost by 40% and accelerating query performance 15×.
- Developed a Spark-Streaming fraud-detection job processing 1M+ events per second, cutting the false-positive rate from 3% to 0.8% and saving an estimated $2 M annually.

PROJECTS

ClauseGuard – Chrome Extension | chromewebstore.com/clauseguard

- Developed ClauseGuard, a privacy-first Chrome extension that locally scans Terms-of-Service pages and highlights 40+ risky legal clauses (e.g., forced arbitration, data-sale permissions) with severity-weighted scoring.
- Processes all text offline-zero network calls, zero telemetry-protecting 100% of user data while giving instant, color-coded risk summaries across seven legal categories.

TECHNICAL SKILLS

- **Languages & Frameworks:** Java, Spring Boot, Python, JavaScript, TypeScript, C/C++, React, Node
- **Cloud, DevOps & Data:** Kubernetes, Docker, CI/CD, Terraform, SQL, MongoDB, AWS, GCP, Ansible
- **Tools & Concepts:** RESTful APIs, Microservices, Distributed Systems, Grafana, Prometheus, Git

EDUCATION

Northeastern University | *Master of Science, Computer Science* **Dec 2024**

University of Pune | *Bachelor of Science, Computer Science* **May 2021**
